

# Stargetareus

## Life on Stargetareus

*Life on this planet is amazing as this planet has many forests and trees and fields full of pink and blue and purple flowers. Stargetareus' life began similar to the way Earth's did; volcanoes. Magma started to build up in layers underneath the ground 40,000,000 years ago. Suddenly it burst and erupted out of the ground but because the tectonic plates didn't trigger it, there were no volcanoes. After that life started to evolve on Stargetareus, no people though; the whole planet is still run by animals. Through the orange canyons trickling with water to the fields and the mountains creating beauty.*

## Animals

*Animals still run this planet but there are not many species of them. There are only 10 animal species here their names are Taurominal, Sentorcam, Releshim, Cactistal, Snitch, Dung spiders, Wish Wash, Mondoves, Flutterbyes and Lightstoms. Taurominal are big bulls which are a pretty good meat source for predators but before you get the meat you have to get past its 30 inch deep, 7 inch wide, sharp horns. It grazes in the fields and then has its offspring in the forests. Sentorcam are enormous snakes 60 feet long and 20 feet wide. They sneak up on Taurominal and then bite and eat young, old and sometimes middle aged, like hyenas. They mate in the canyons and have their offspring there.*

*Releshim lives under water in little caverns. They look like sharks except their teeth are much longer. So long in fact that they hang out of its mouth. It has a diet of Wish Wash so when they think its mouth is a coral it closes its jaw and feasts. Unlike most of the animals here Releshim lays its offspring in eggs in caverns where there is just a little bit of a narrow oxygen area. Once they are laid the mother leaves them. Wish Wash are fish that live in the corals of the ocean. They eat plankton that thrive in caverns or corals and provide protein and nutrients for Releshim. They lay their offspring in the anemone so they are protected from Releshim and can bring on the next generation. In return the Wish Wash cleans the plankton of the anemone.*

*Mondoves live in the treetops away from predators and try to never come down because waiting below is Sentecorm who can make an easy meal out of Mondoves. Mondoves are herbivores and eat the leaves off of Jiunjel trees. They are mammals and have their offspring in the hollows of the trees they also live there. They try not to get into sticky situations with their neighbors but sometimes they get into fights because they are very violent.*

*Flutterbye are butterflies that only live for a few days and lay their eggs on plants. There are also Dung spiders who eat the dung of other animals and are great grubs for protein and fibre. Cactisle have big spikes to catch their prey and have water stored up inside of them which other animals want. Snitches are little annoying birds that fly at a speed of 240 miles per hour. They have lookouts and workers, soldiers and a queen. The lookout tells the flock if there is a predator and the whole flock moves. The workers gather food like leaves, bugs and more. The soldiers guard the queen and the queen lays the other birds.*

*Light Storms are very rare and cause floods, sunny weather, dry season and spring. They lay their offspring in the hottest place they can find and eat Sentecorm.*
